(http://www.jax.org/resources/documents/dhares/). The DNA was hydrodynamically sheared by repeated passage through a was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was bunt end-repaired with TA DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarcose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gil4722114)ghPt29072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

/note="Vector: PWD42nv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonaleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (qi1473214) (pblA129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

Tbdn-1 proteins having anti-angiogenic activity are associated with acetyl transferase activity. They regulate endothelial differentiation through protein acetylation, DNA-binding or by interacting with and/or acetylating other protein

useful

cc targets important for endothelial differentiation. In normal adult eyes, tbdn-1 is expressed highly in the corneal endothelium proper and in the vascular endothelium of the limbus and retina. Tbdn-1 cornea en useful for preventing, inhibiting or delaying proteins are useful for preventing, inhibiting or delaying corneased of angiogenesis-associated disease, such as preferably corner or angiogenesis-associated disease, such as preferably diabetic retinopathy or retinopathy of prematurity, or primary confluctions in the preparatic vitreous, macular degeneration and any other conditions in hypothelia preparation. Tbdn-1 proteins are also useful for treating any pathological neovascularisation condition such as cancer, burns, scars, nonunion fractures, retrolental fibroplasia, creating ocular neovascularisation conditions such as chronic glaucoma, creating ocular neovascularisation of the optic nerve. Sequences of the invention are also used in gene therapy. The present sequence is changing the inhardown-1 nordsing turbenses. Sequence 3418 BP; 1157 A; 604 C; 704 G; 953 T; 0 other; cDNA encoding tubedown-1 proteins.

The sequence represents a new human gene, tubedown-1 (tbdn-1). The invention relates to a novel isolated nucleic acid of the tubedown-1 gene, and antisense nucleic acids to thon-1. The polynucleotides and protein of the invention have cytostatic and osteopathic activity. The polynucleotides of the invention may be used in antisense-therapy/gene therapy. They are useful in the treatment of bone tumours, especially osteosarcoma and Ewings sarcoma family of tumours, the compounds of the invention may also be useful for the prevention of metastases from these types of tumours, either alone or in combination with radiotherapy and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               457

The sequence represents tubedown-1 (tbdn-1) bases 3418-1 antisense CDNN. The invention relates to a novel isolated nucleic acid of the tubedown-1 gene, and antisense nucleic acids to tbdn-1. The polynucleotides and protein of the invention have cytostatic and osteopathic activity. The polynucleotides of the invention may be used in antisense-therapy/gene therapy. They are useful in the treatment of bone tumours, especially osteosacroma and Ewings sarcoma family of tumours. The compounds of the invention may also be useful for the prevention of metastases from these types of tumours, either alone or in combination with radiotherapy and/or
                                                                                                                                                                                                                                                                                seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqn-emb1/NA2002.DAT:AAH77158
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid molecules antisense to the tubedown-1 gene prevent overexpression of tubedown-1 protein and are useful to treat osteosarcoma and Ewing's Sarcoma family of tumours
                                                                                                                                                                                                                                                                                                                                                                                                                      antisense; cytostatic; osteopathic;

The invention relates to isolated polynucleotide (I) and polymerase chain reaction (PGR) primers, oligomers, and for chromosome polymerase chain reaction (PGR) primers, oligomers, and for chromosome and gene mapphing, and in recombinant production of (II). The cand gene mapphing, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) and (II) and (II) and (II) and (II) conducts are useful for treating clisorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in the polypeptide and polynucleotide sequences have applications in capponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and and a mino acid sequences. Asketlay? AskS494544 represent novel human diagnostic coding sequences of the invention.

Specification, but was obtained in electronic format directly from WIPO of the state of the content of the printed in electronic format directly from WIPO

The sequence represents tubedown-1 (tbdn-1) bases 1413-1 antisense cDNA. The invention relates to a novel isolated nucleic acid of the tubedown-1 gene; and antisense nucleic acids to tbdn-1. The polynucleotides and protein of the invention have cytostatic and osteopathic activity. The polynucleotides of the invention may be used in antisense therapy/gene therapy. They are useful in the treatment of bone tumours, especially osteosarcoma and Ewings sarcoma family of tumours. The compounds of the invention may also be useful for the prevention of metastases from these types of tumours, either alone or in combination with radiotherapy and/or chemotherapeutic agents.
                                                                                                                                              seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqn-embl/NA2002.DAT:AAH77157
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acid molecules antisense to the tubedown-1 gene prevent overexpression of tubedown-1 protein and are useful to treat osteosarcoma and Ewing's Sarcoma family of tumours

Claim 8; SEQ ID 15380; 2537pp + CD ROM; English.

The present invention describes primer sets for synthesising 5602

C full-length cDNAs defined in the specification. Where a primer set

C comprises: (a) an oligo-dT primer and an oligonuclectide complementary

C complementary strand of a polynucleotide which comprises one of

to the complementary strand of a polynucleotide which comprises one of

C c complementary strand of a polynucleotides; or (b) a combination

C c complementary strand of a polynucleotide which comprises a 5'-end

C c complementary strand of a polynucleotide which comprises a 5'-end

C c complementary strand of a polynucleotide which comprises a 5'-end

C c complementary strand of a polynucleotide which comprises a formation of

C c complementary strand of a polynucleotide which comprises a fleast 15 nucleotides and the complementary to a

C c cigonucleotide comprises a 1 least 15 nucleotides and the complementary to a

C c cigonucleotide comprises a 1 least 15 nucleotides and the complementary to

C c cigonucleotide comprises a sequence is selected from those defined in

C c cigonucleotide comprises a test 15 nucleotides and the complementary to

C c cigonucleotide comprises a least 15 nucleotides and the complementary

C c particularly full-length cobms. The primers are also used in for the

C c particularly full-length cobms. The primers also used in the proteins encoded by

C c particularly without any specialised methods. AAH03166 to AAH13628 and

C c c DNAs asally without any specialised methods. AAH03166 to AAH13632

C C AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632

C C F the processent invention

cc the 5'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and or in gene therapy. The primers are useful for synthesising polynucleotides, in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the particularly full-length cDNAs. The primers are also useful for the cc detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs are as any specialised methods. AAH03166 to AAH13628 and cDNAs easily without any specialised methods. AAH03166 to AAH13628 and cc AAB95893 represent human cDNA sequences; and AAH13629 to AAH13632 crepresent oligonucleotides, all of which are used in the exemplification cc of the present invention.

```
This invention describes a nucleic acid (I) with differential expression between tumour and normal calls and which has cytostatic activity. (I) work as modulators of Ras activity by inducing expression of tumour suppressor genes: (I), and polypeptides encoded by them, are useful as targets for diagnosis or therapy and in screening to determine the effects of an active compound (potential pharmaceutical) on a cell line, particularly for diagnosis and treatment of tumous, especially by modulating expression of (I) (by gene therapy, antisense RNA or ribozyme methods) or by modulating the amount and/or location of (I)-encoded polypeptides (by administration of the polypeptide or its activator, antibody (optionally as a conjugate) or inhibitor). The method allows
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acids differentially expressed between tumor and normal cells, useful for diagnosis or therapy of tumors and for screening active

identification of many Class II tumour suppressor genes (i.e. genes are not primary targets for tumour-initiating mutations).

AAH81492-AAH82376 represent the human and rat derived nucleic acid fragments described in the method of the invention.
                                                                                                                                                                                                                   103 TrpValGlnTyrTyrLeuAlaGlnHisTyrAspLysIleGlyGlnProSe 119

The present invention describes a library of human polynucleotides comprising the sequences given in AAZ1253 to AAZ17779. Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by one of the 5248 polynucleotides sequences given in AAZ1253 to AAZ1779. The polynucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, mapping, tissue typing or profilling, forensics, genetic analysis and catection of polymorphisms. Polypeptides encoded by the polynucleotides can be used for raising antibodies for experimental, diagnostic and therapeutic purposes. The polynucleotides may also be used to construct arrays for diagnostics (which may be used to deternition of an encoded protein); and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to identify a genetic predisposition or susceptibility to a disease such as cancer). The polynucleotides of the invention are especially used in the content. The polynucleotides can also be used to screen for and lung cancer. Preparagement of colorectal cancer, breast cancer, and lung cancer. Preparagement of colorectal cancer, breast cancer.

New isolated human polynucleotides Claim 1; Page 564; 591pp; English.

WPI; 1999-430243/36.

```
This invention describes novel isolated human polynucleotides obtained by screening for differential expression in colon cancer, breast cancer and lung cancer cell lines. The polynucleotides of the invention are represented in AAX98275-X991B and encode polypeptides of protein can lines. The mansmembrane segments integral membrane captures selected from 4 transmembrane segments integral membrane capturities selected from 4 transmembrane segments integral membrane capturities (AAA), eukaryotic aspartyl proteases, dATA family of transcription factors, G-protein apha subunit, phorbolesters or transcription factors, proteins, protein kinase, protein phosphatase, trypsin, wnt family of developmental signalling proteins and ww/rsp5/wwp domain containing proteins. The corded polypeptides also have a functional domain selected from Ank encoded polypeptides also have a functional domain selected from Ank encoded polypeptides also have a functional domain selected from Ank encoded polypeptides also have a functional domain selected from Ank encoded polypeptides also have a functional domain selected from Ank encoded polypeptides with similarity to known domain. The polynucleotides encoded polypeptides with similarity to known contain families and are predicted to have similar properties. The novel protein families and are predicted to have similar properties. The novel captures and in forensics, genetic analysis, mapping and diagnostic applications. In particular, the product can be used for the detection and management of cancers. They can be used for treating e.g. cervical and management of cancers. Integral adenocarcinomas, leukemia, and mydric cancers, melanomas, colorectal adenocarcinomas, leukemia, and mydric cancers, melanomas and in promedical perkemia, monocytic leukemia, and supplements and and lymphomas such as histlocytic leukemia, and mydric concerning and subsellation and subsellation and subsellation encoded perkemia, such as histlocytic leukemia, encoded perkemia, subsellation encoded perkemia encodenial d

The present invention describes a library of human polynucleotides comprising the sequences given in AA212532 to AA21779. Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by one of the 5248 polynucleotide sequences given in AA212532 to AA217799. The polynucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, compaping, tissue typing or profilling, forensics, genetic analysis and detection of polymorphisms. Polypeptides encoded by the polynucleotides can be used for raising antibodies for experimental, diagnostic and therapeutic purposes. The polynucleotides may also be used to construct arrays for diagnostics (which may be used to determine function of an encoded protein); and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to didentify a genetic predisposition or susceptibility to a disease such as cancer). The polynucleotides of the invention are especially used in the diagnosts, prognosis and management of colorectal cancer, breast cancer, and lung cancer. The polynucleotides can also be used to screen for nonvival and constructors.
                                                                                                                                                                      Human; gene; gene expression product; diagnosis; therapy; probe; detection; mapping; tissue typing; profilling; forensic; cancer; genetic analysis; colorectal cancer; breast cancer; lung cancer; ss.
                                                                                                                                     Human gene expression product cDNA sequence SEQ ID NO:3452.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ΰ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel human genes and their expression products which are differentially expressed in different cell types

This invention describes novel isolated human polynucleotides obtained by screening for differential expression in colon cancer, breast cancer and lung cancer cell lines. The polynucleotides of the invention are represented in AAX98275-X991918 and encode polypeptides of protein corpresented in AAX98275-X991918 and encode polypeptides of protein from 4 transmembrane segments integral membrane proteins, 7 transmembrane receptors, Arpases associated with various collular activities (AAA), eukaryotic aspartyl proteases, GATA family of transcription factors, G-protein alpha subunit, phorbolesters or diacylglycerol binding proteins, protein kinase, protein phosphatase 2C, diacylglycerol binding proteins, protein kinase, protein phosphatase 2C, corpotein tyrosphatase, trypsin, whi family of developmental concoded polypeptides also have a functional domain selected from Ank repeat, basic region plus leucine zipper transcription factors, repeat, basic region plus leucine zipper transcription factors, commodomain, EF-hand, SH3 domain, WD domain/G-beta repeats, zinc finger (CCHC class), and zinc-binding metalloprotease (CH2 type), zinc finger (CCHC class), and zinc-binding metalloprotease commain. The polynucleotides encode polypeptides with similarity to known protein families and are predicted to have similar properties. The novel polynucleotides can be used to develop products for use as therapeutic complexities and in forensics, genetic analysis, mapping and diagnostic cancers, melanomas, colorectal adenocarcinomas, Nilm's tumour, sarcomas, cancers, melanomas, colorectal adenocarcinomas, leukemias, such as chronic myeloid leukemia, and lymphomas such as histlocytic leukemia, and management of cancers. They can be used for treating e.g. cervical myeloid leukemia, promyelocytic leukemia, monocytic leukemia, and lymphomas such as histlocytic leukemia, and management of cancers and product can be used for the cervic depithelial dysplasia of the cervix, fibrous dysplasia, of the cervix, fibrous dysplasia, of the cervix fib
Wilm's tumour; retinoblastoma; sarcoma; myosarcoma; lung carcinoma; leukemia; lymphoma; dysplasia; hyperplasia; endometrium; adrenal;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Crkvenjakov R, Dickson M, Drmanac R, Drmanac S;

for diagnosis and

useful :

```
The invention relates to new polynucleotides and polypeptides, useful for diagnosis and treatment of breast, lung and colon cancer. The sequences can be used in detecting differentially expressed genes correlated with cancercus state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample derived from a cell suspected of being cancerous. They can also be used to inhibit tumour growth by modulating expression of a gene product. AAS36943-AAS39338 represent novel human diagnostic and therapeutic coding sequences of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes primer sets for synthesising 5602 (ull-length cDNAs defined in the specification. Where a primer set (ull-length cDNAs defined in the specification. Where a primer set (a) an oligo-dr primer and an oligouncleotide comprises one of to the complementary strand of a polynucleotide which comprises one of compouncleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to the oligonucleotide which comprises a 3'-end sequence. The complementary to a polynucleotide which comprises a 3'-end sequence of an oligonucleotide comprises at least 15 nucleotides and the compination of the 5'-end sequence. The primer sets selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, in gene therapy. The primers are useful for synthesising polynucleotides and individual diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the the full-length cDNAs. The primers are also useful for the the full-length cDNAs are primers and shall state of the AMH13613 to AAH13613 to AAH13613 to AAH13613 to AAH13613 to AAH36180 to AAH136130 to AAH36180 to AAH136130 to AAH36180 to AAH136130 to AAH36180 to A

DNA encodes N-alpha-actyl transferase, used for catalysing N-acetylation of peptides/proteins, eg to stabilise pharmaceuticals or to induce herbicide resistance in plants. Features a - n are fragments resulting from exonuclease III deletion. See also AAP91070.
                                                                                                                                                                                                                                                                                                                                                                                              New pure N-alpha-acetyl transferase and DNA encoding it - catalysing acetylation of proteins and peptides, eg to stabilise pharmaceuticals or induce herbicide resistance in plants.
